Evaluation of new analytical methods to detect lower quality olive oils

Project funded by Australian Government – Rural Industries Research and Development Corporation (PRJ 003349)

INTRODUCTION

The project is divided in three areas:

- Australian supermarket Extra Virgin Olive Oil (EVOO) screening,
- Australian varieties and environmental screening, and
- Evaluation of the impact of storage conditions on those varieties.

This summary only presents the supermarket extra virgin olive oil screening results.

MATERIAL AND METHODS

The **retail screening** implied sampling extra virgin olive oils from the shelves of the main Australian supermarkets, food service distributors and boutique shops in Australia (Woolworths, Coles, Aldi, IGA, Foodworks and Oliv). The sampling was repeated in December 2008, 2009 and 2010. The total samples analysed were 265. The analysis carried out in order to determine their compliance with the grade were: Free fatty acids (FFA). AOCS Ca 5a-40. Peroxides value (PV). AOCS Cd 8-53. UV coefficients (K_{232} , K_{270} and ΔK). AOCS Ch 5-91. Fatty acid profile (FAP). IOC/T.20/Nº 24. Panel Test (PAT). IOC/T.20/Nº 15. Pyropheophytins A (PPPs). ISO 29841:2009. 1,2-Diacylglycerol Content (DAGs). ISO 29822:2009. Induction time (IND). AOCS Cd 12b-92.

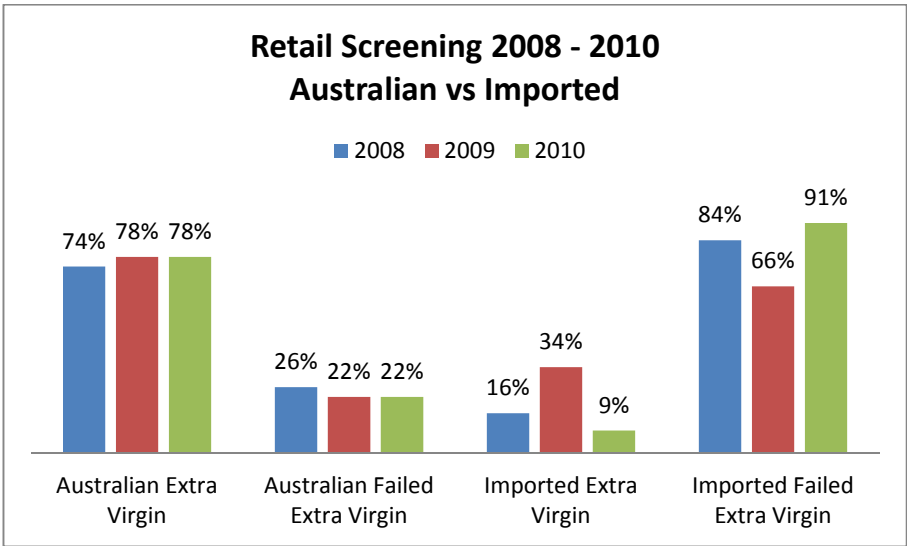

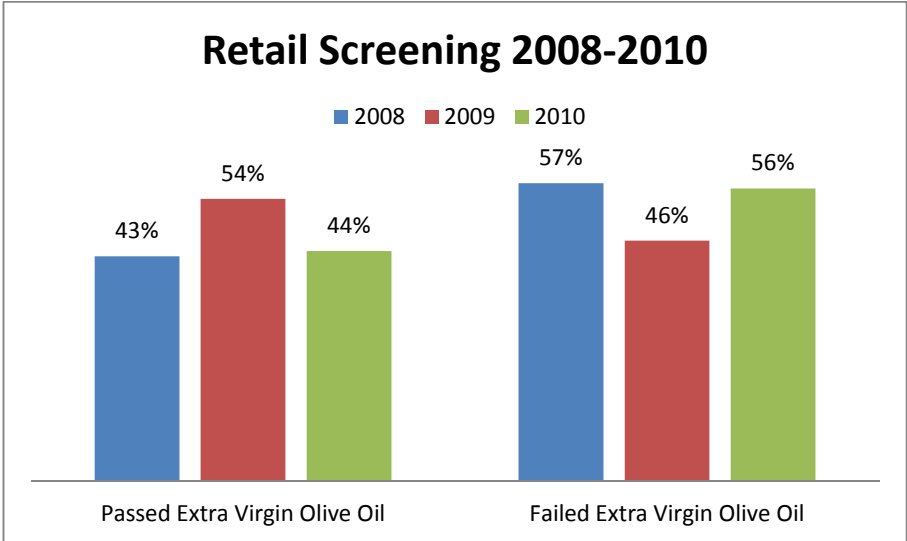

RESULTS

SUPERMARKET SCREENING

During the 3 years of retail screening, 265 samples were taken (127 from Australian producers and 138 from imported oils). The overall results show extremely poor quality control in the Australian retail market. More than a half of the oils labelled as EVOO are not true to label. A summary is presented in the graphs below.

During the first extra virgin olive oil (EVOO) retail screening conducted in 2008, 97 samples of local and imported products were taken from a number of retail stores as mentioned before. Only 43% of the EVOO in the Australian market are consistent with the grade stated on the label. 46% of the oils failed current international standards (International Olive Council (IOC) and Codex) for EVOO grade. 78% of those oils that failed the international standards also failed the studied ISO methods based on the limits proposed in Germany (<15% for PPPs and >40% for DAGs). Only 10% of the studied oils only failed the ISO tests. During the second screening conducted in 2009, 98 samples of local and imported oils were studied showing a slight improvement in the overall quality. Just over the half of the samples (54%) are consistent with the grade. 29% of the oils failed current international standards for the EVOO grade with 72% of those oils also failing the studied ISO methods (PPPs and DAGs). 17% of the studied oils only failed the ISO tests. During the last screening conducted in 2010, 70 samples were taken from the different retail stores. Similar behaviour of the first screening was observed. Only 44 % of the EVOOs sampled were consistent with the grade. 42 % failed the

international standards for EVOO grade. 76% of those oils which failed the international standards have also failed the studied ISO methods based on the limits proposed in Germany. 14% of the tested oils only failed the ISO methods.

The complete reports will be available from Australian Government – Rural Industries Research and Development Corporation (PRJ 003349) in December 2011.

Summary of Supermarket Studies 2008/09 - 2009/10 - 2010/11
