

**Submission to Senate Standing Committees on Environment and  
Communications  
Renewable Energy (Electricity) Amendment (Excessive Noise from Wind Farms) Bill  
2012**

by

**Dr David Burraston  
BSc(Hons) PhD**

I support these proposed amendments to the Renewable Energy Act, because of the need for transparency about the noise and wind mast data, and for serious consequences for breaches of noise guidelines (non payment of RECS) if wind farm owners break the rules. I live on a farm near Cootamundra, and there are a number of proposed wind farm developments in our area, which will impact my family and friends if they go ahead.

There is a growing body of published research in this area, which I hope will be of use in supporting these proposed amendments. I have listed a number of research publications below. In addition the Acoustic Ecology Institute publishes a well balanced report on wind farm noise each year, as well as providing pdf files of a number of key papers on wind farm noise:

Thank you for taking the time to consider this submission.

Dr David Burraston  
BSc (Hons), PhD

This paper covers limitations and problems with the sound propagation standard (ISO 9613-2). This standard model is used for noise assessment studies in the NSW environmental assessments. **A key point with relation to wind energy developments is that the ISO 9613-2 model can give no estimation of its own accuracy beyond 1km, yet it is routinely used for distances exceeding 1km.**

Reviews sound studies conducted by consultants for governments, wind turbine owners, and local residents for a number of sites with known health or annoyance problems. The purpose is to determine if a set of simple guidelines using dBA and dBC sound levels can serve as the ‘safe’ siting guidelines.

*“This community based surveillance activity was conducted under the guidance of Dr. Robert McMurtry, the Former Dean of Medicine at the University of Western Ontario. The health survey revealed that out of 76 respondents, 53 people now living near different wind power facilities in Ontario reported that industrial wind turbines were having a significant negative impact on their lives. The adverse effects range from headaches and sleep disturbance to tinnitus (ringing in the ear) and depression.”*

Northern Maine Medical Center (2009) "*Health Concerns and the Need for Careful Siting of Wind Turbines*" Press Release March 4, 2009

Medical Staff of Northern Maine Medical Center unanimously approved this press release and requested a moratorium on "wind farm" developments. Three excerpts from this press release :

*"We echo the concerns of the Medical Staff of Rumford Community Hospital as regards an increasing body of literature and reports from Canada, the USA, and particularly from Europe suggesting that the deployment of industrial wind facilities in close proximity to places where people live, work or attend schools results in negative health effects, including and especially sleep deprivation and stress."*

*"These effects arise not only from audible noise frequencies but also from persistent inaudible low frequency noise waves of a cyclical nature which are felt, but not heard. There are a growing number of scientific observations and studies suggesting that people living up to 2 miles away from these industrial wind farms may be affected."*

*"In light of these growing, serious medical concerns, we propose a moratorium on the building of any such "wind farms" until more research is done on the health impact that such facilities will have on the communities surrounding such technology. These communities and the Maine DEP and Health Services must be allowed time to study and learn from the European and Canadian experiences, as well as from the many affected families in Mars Hill, Maine, and put into place appropriate regulation prior to expanding the wind industry in the State of Maine."*

The research of van den Berg shows that there are significantly higher levels of noise pollution at night than are experienced in the daytime, and the effects of complex terrain such as hills are different to flat terrain. Sound levels can be up to 15dB higher at night relative to the same reference wind speed in daytime. These papers also discuss the flawed methodology of wind induced microphone noise during background sound monitoring.
